

NETConductor provides the ability to fully utilize the Dynamics NAV business logic embedded in the various applications and seamlessly request and pass information to and from Dynamics NAV. This means that new applications, such as Web, Mobile, Handheld and Windows applications and services, can be written to utilize business logic and data structures that are already in place within your Dynamics NAV system.

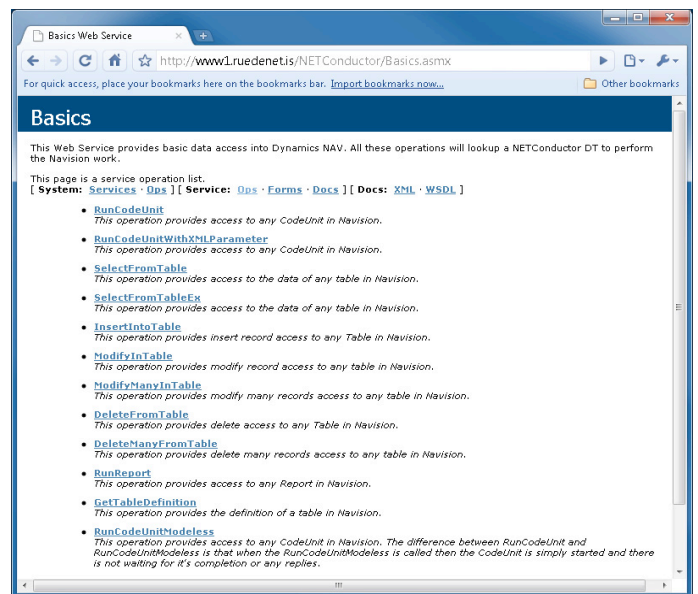

Integrating solutions with NAV

The NETConductor can be used for any sort of solution that requires connectivity to Dynamics NAV, including web sites, E-commerce, visualization solutions, portfolio solutions, job journal solutions, integration and CRM connections. These are only a handful of the applications the NETConductor has been used for. Surely you can think of one. NETConductor has been in development for years and is being used every day to its fullest by some of the largest companies in Iceland and around the world. In this way it has proven itself as a worthy tool to integrate solutions with Microsoft Dynamics NAV.

Standard technology

The NETConductor provides a new access route to Dynamics NAV application logic and data. This route is a standard XML web service interface, which allows Dynamics NAV to communicate with all applications built using Microsoft's .NET framework. The XML web services technology is core to Microsoft's .NET strategy and with the NETConductor installed, Dynamics NAV applications can now become part of a company's .NET environment.

Main features

- Dynamics NAV applications online
- Dynamics NAV connected to the web
- Standard .NET based XML web services
- Communicate with external web services from NAV
- Build new applications on top of existing NAV applications
- Easy access to business logic within NAV
- Easy access to data structures within NAV
- Easy access to reports within NAV
- Decreases the number of NAV users of your license
- May lower your annual upgrade fee
